Custom Twitch.tv Client

Project Description

Implements a customized client for viewing livestreams from Twitch.tv.

An instance of the client supports simultaneously viewing up to 4 livestreams with 3 viewing settings:

1. a single stream with its chatroom
2. two streams with their respective chatrooms
3. four streams

Furthermore, the project supports viewing multiple instances of a client over multiple monitors (up to 3 monitors). Therefore, **a maximum of 12 livestreams** can be viewed simultaneously.

Motivation

At the initial time of project conception, Twitch.tv did not offer a method to view multiple livestreams simultaneously.

Thus, one would have to commonly choose one of the following compromises:

1. Open multiple browser tabs but only focus on one, potentially missing entertaining segments of the other livestreams.
2. Open multiple browser tabs and manually organize the windows but also having to endure the tedium, especially as the number of livestreams scale.
3. Open only one browser tab but forgo all other livestreams, completely unaware of any entertaining segments of the other livestreams.

In this regard, I conceived of the idea of a customized client, capable of viewing multiple livestreams simultaneously and being controlled effortlessly through hotkeys.

Design Goals

- The client must be capable of viewing multiple livestreams simultaneously.
- Hotkeys should be implemented to facilitate quick control of the client.

Benefits

- **Circumvents ads from Twitch.tv by leveraging the `streamlink` module**

- Integrates with my personal Twitch.tv account

- Minimizes footprint, compared to a web browser, by embedding the mpv media player into the Qt GUI

- Provides quick control via hotkeys, removing the need to resize or move the client by dragging

- Allows for the alerting of livestreams under special conditions, such as when viewer count hits a desired threshold, usually indicating that a special event is occurring

Languages

1. Python 3.8
2. AutoHotkey 1.1

Python Dependencies

1. requests
2. streamlink
3. psutil
4. pyqt6
5. python-mpv
6. python-twitch-client

External Dependencies

1. Libmpv
2. Chatterino 2

Established first prototype capable of viewing up to 2 livestreams.

↓

Integrated with Twitch.tv API, allowing for subscribed livestreams to be listed; requires an authentication token to be manually generated every few months.

↓

Experienced instability and crashing; use of a single thread would cause memory errors when viewing 2 livestreams over a prolonged duration.

↓

Designed a custom wrapper for the mpv media player; now employs threads and separate processes to prevent memory errors.

↓

Reorganized the project by separating it into components: Twitch integration, livestream clients, and the mpv media player. Facilitates incremental upgrades.

↓

Added quality-of-life upgrades, such as aliases for favorite livestreams.

↓

Created a new client capable of viewing 4 livestreams by modifying the dual mode setting: abandoned chatroom windows for additional screen space; added additional livestreams; and ensured symmetry among all livestreams.

→

Twitch.tv retires its old API, breaking integration.

↑

Adapted the program to use Twitch's new API and designed a new approach to generating authentication tokens. Tokens are now automatically generated upon client execution.

↑

Unreliable internet connectivity results in a dead client as livestream playback suspends indefinitely.

↑

Designed a method to prompt the user for new livestreams regardless of the state of the client; results in new functionality: the ability to reselect or refresh livestreams.

↑

Experienced instability due to using web browsers for chatroom windows. The web browser had recently updated.

↑

Replaced the web browser with a dedicated program for Twitch.tv chatrooms: Chatterino2. Increases stability as the chatroom program does not need to be updated as often.

↑

Complete removal of all web browser dependence reduces project footprint.

Features

## 1. Selection of a desired or subscribed streamer

The project employs the API of Twitch.tv to list online streamers in which my personal account is subscribed to. The streamers are listed within the command prompt and the user is asked to select valid livestream(s). A valid livestream is any livestream that is currently online on Twitch.tv.
2. Single Livestream Mode

An instance of the client in viewing one livestream with its corresponding chatroom.

3. Dual Livestream Mode
An instance of the client in viewing two livestreams with their corresponding chatrooms.

4. Volume Control of Individual Livestreams (Any Mode)

The volume of any livestream can be individually controlled regardless of the number of livestreams being viewed.

5. Swapping of Chatroom Windows (Dual Livestream)
The chatroom windows can be swapped during the dual livestream mode.

6. Zooming of Livestreams (Dual Livestream)
Clicking on a livestream will enlarge it and shrink the other livestream during the dual livestream mode.

7. Flipping of Livestreams and Chatroom Windows (Dual Livestream)
The livestreams and chatroom windows can be flipped during the dual livestream mode.

8. Inversion of Livestreams and Chatroom Windows (Dual Livestream)

The livestreams and chatroom windows can be inverted during the dual livestream mode.

9. Quad Livestream Mode

An instance of the client in viewing four livestreams.

10. Clockwise Rotation of Livestreams (Quad Mode)
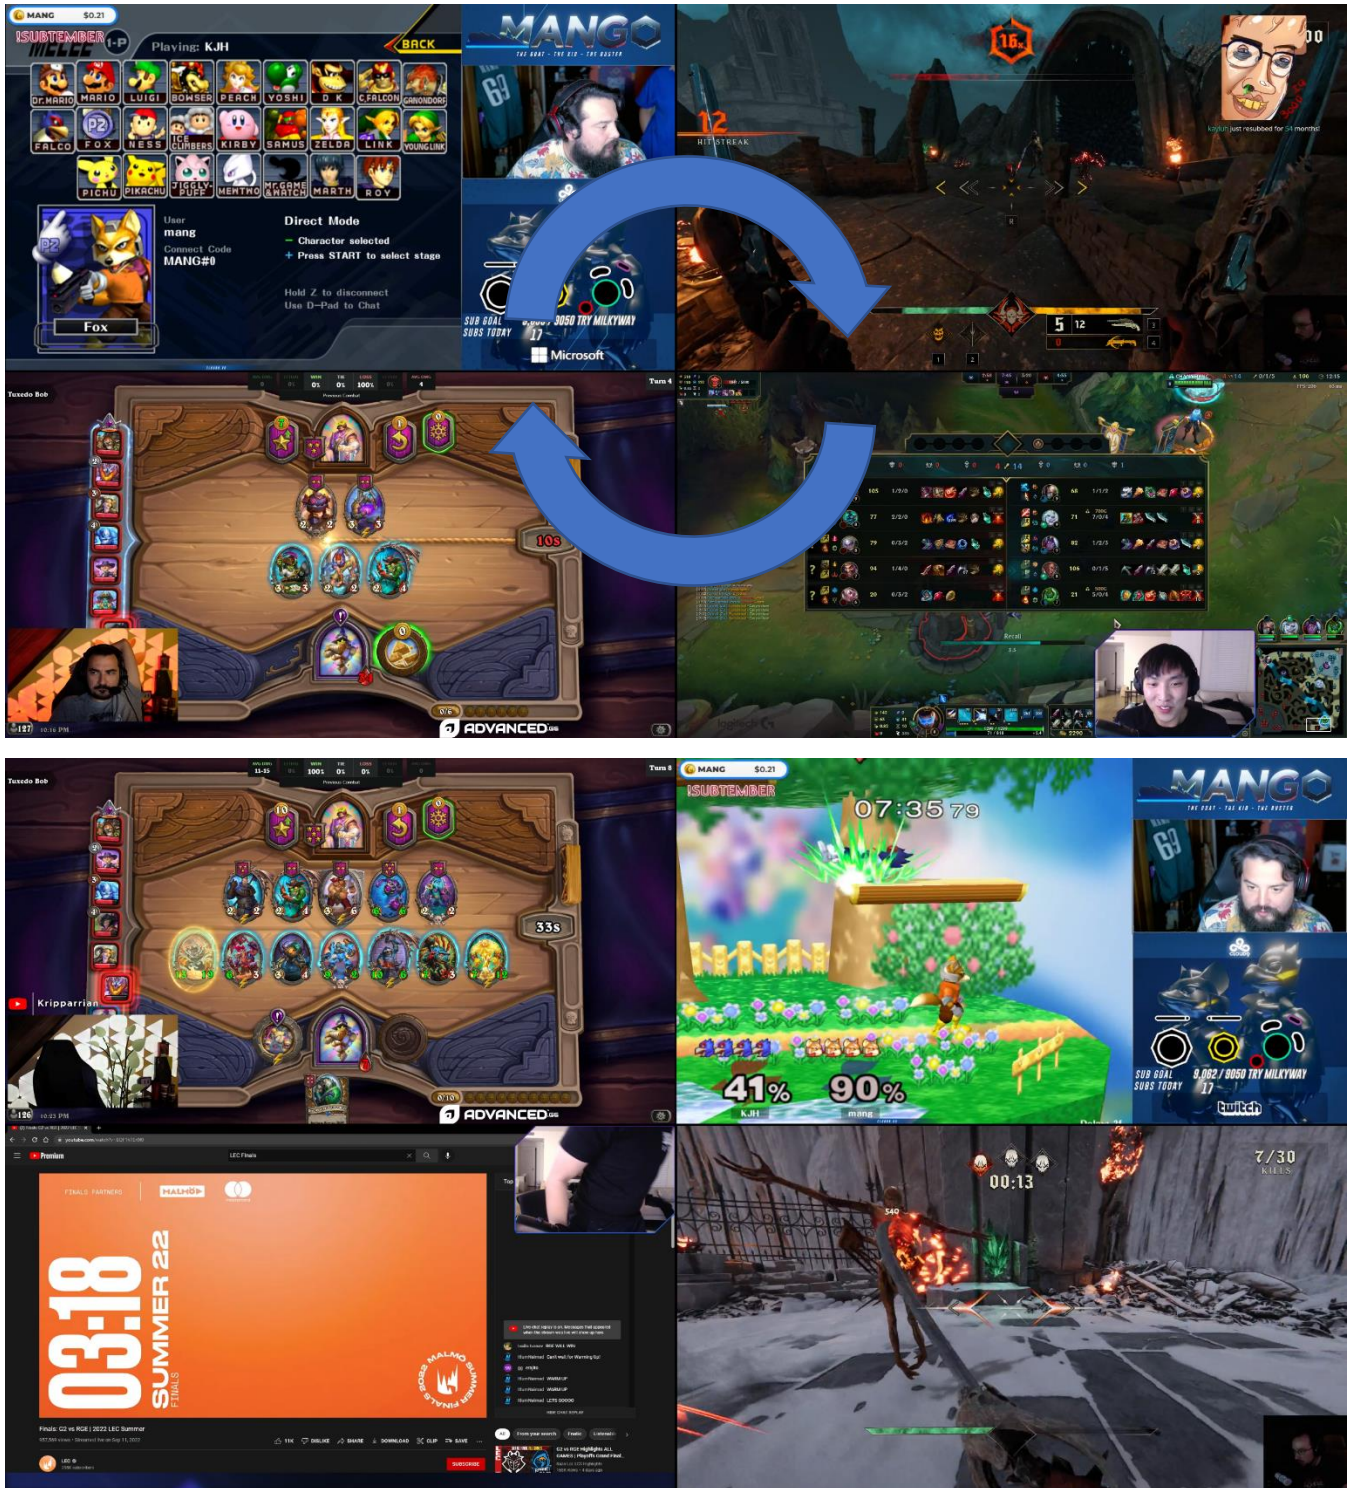

Livestreams can be rotated clockwise during the quad livestream mode.

11. Counterclockwise Rotation of Livestreams (Quad Mode)
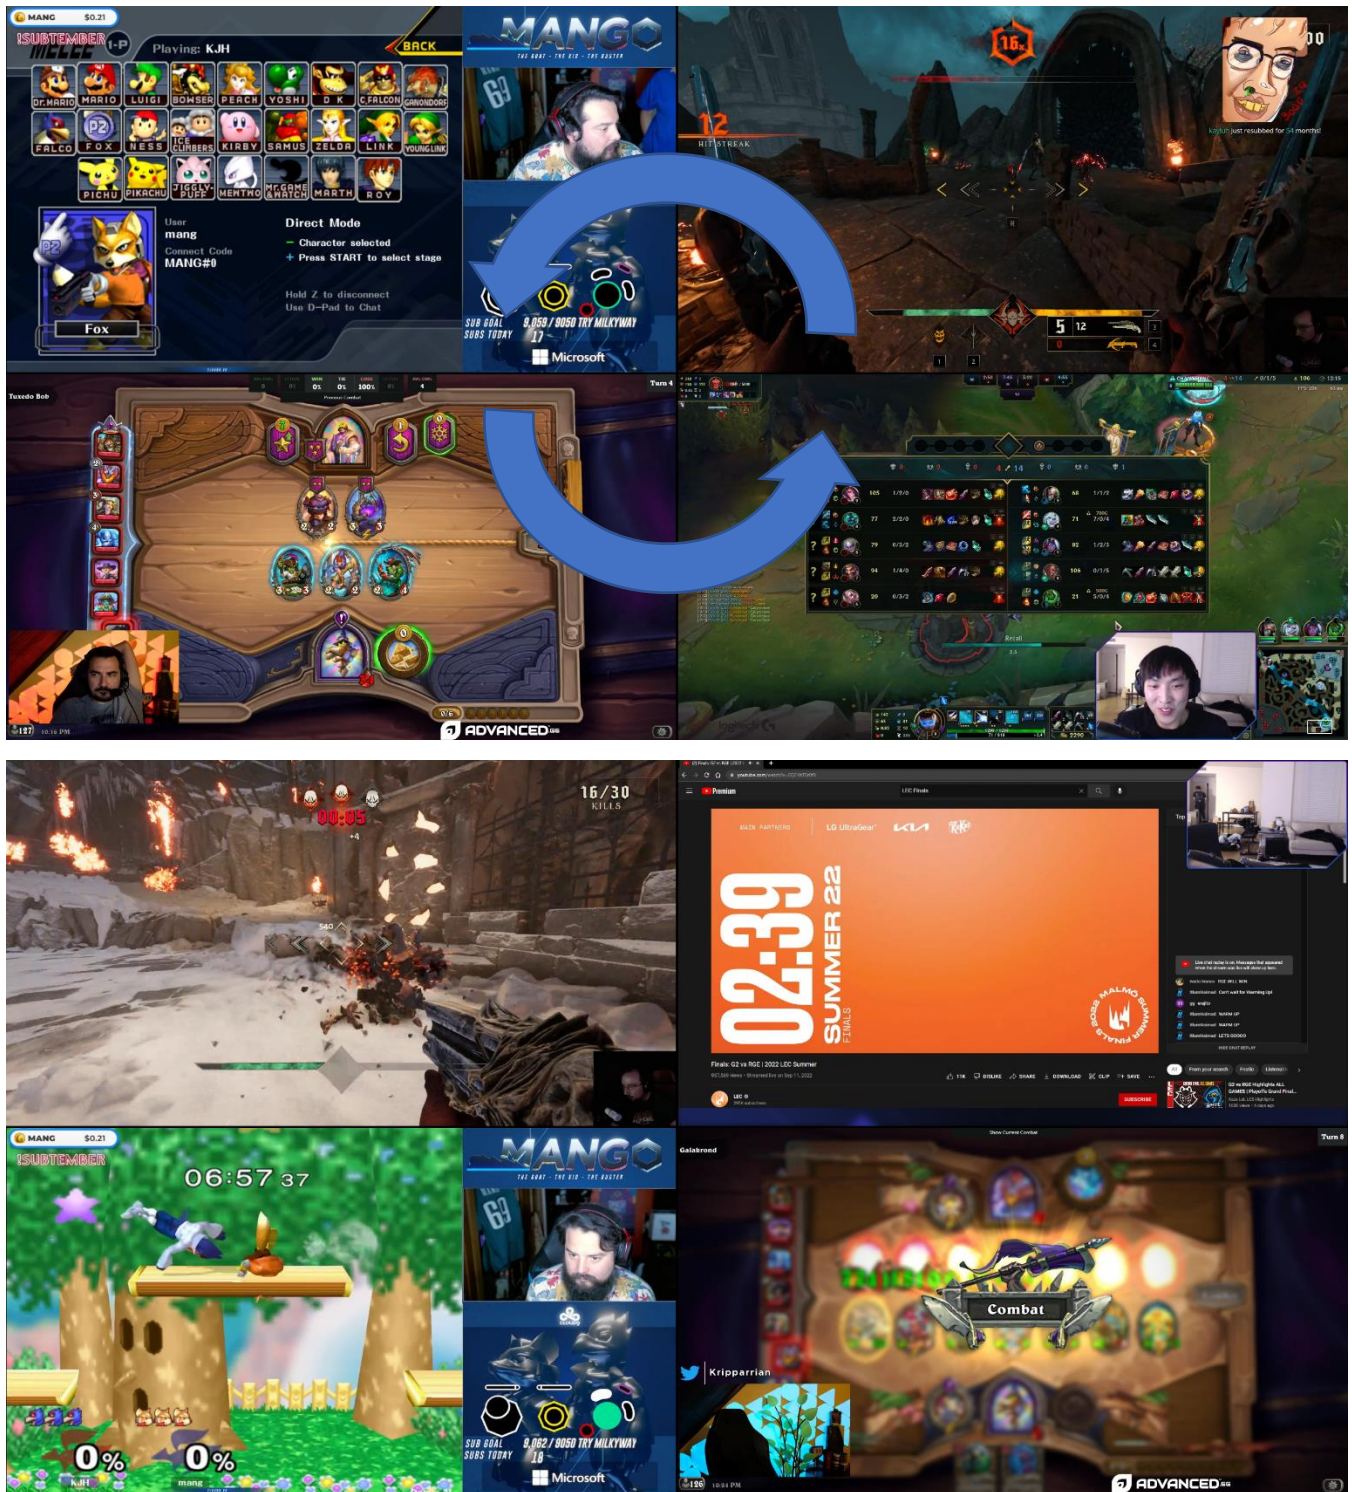

Livestreams can be rotated counterclockwise during the quad livestream mode.

12. Inversion of Top Row of Livestreams (Quad Mode)

The top row of livestreams can be inverted during the quad livestream mode.

13. Inversion of Bottom Row of Livestreams (Quad Mode)

The bottom row of livestreams can be inverted during the quad livestream mode.

14. Multi-Monitor Support and Hotkeys

Multiple instances of a client can be opened simultaneously. Furthermore, hotkeys are implemented to quickly switch clients positions among my 3 monitors.

Credit Activity Tracker
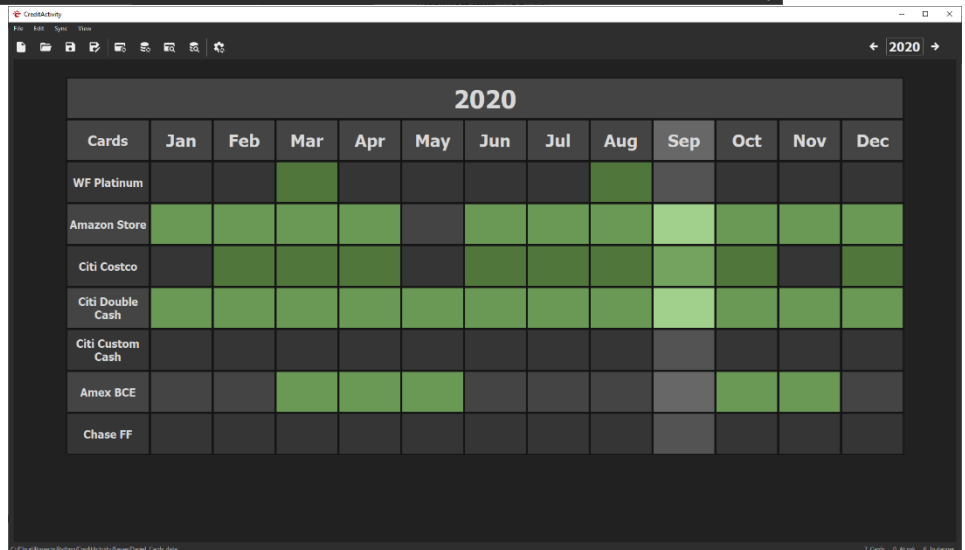

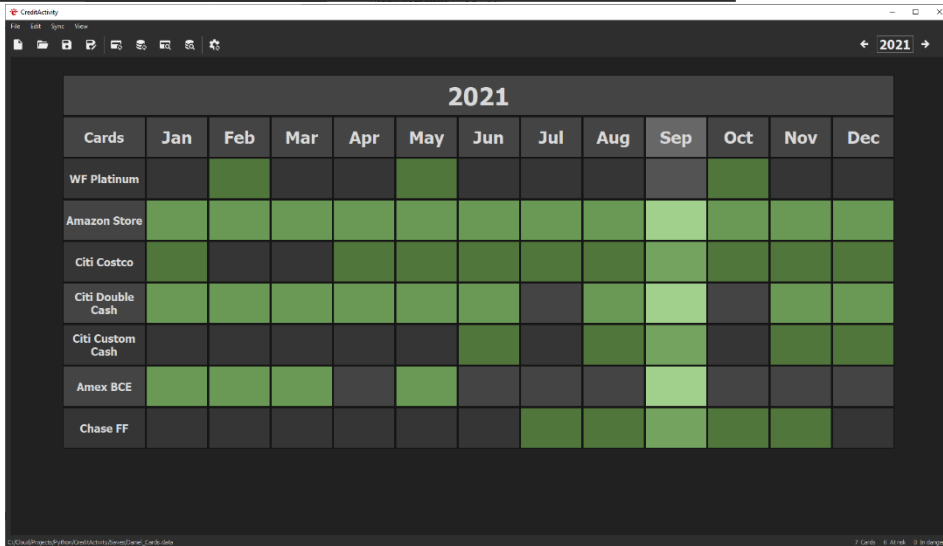

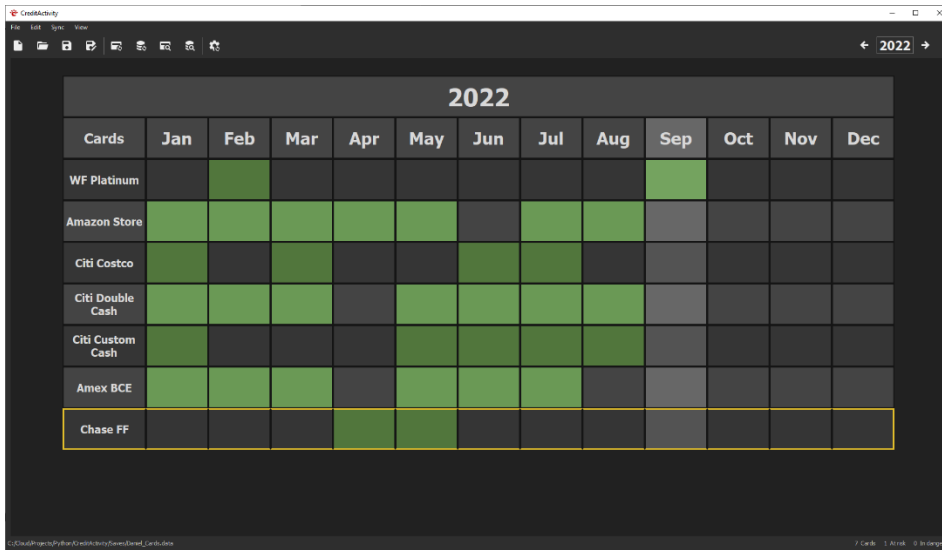

Project Description

Implements an application for tracking my personal credit card activity over multiple years. Furthermore, the project integrates with the API of You Need A Budget (YNAB), a service for budgeting one's finances. As a result, the application allows for easily syncing credit card activity from my personal YNAB account.

Motivation

Often, as one increasingly opens new credit cards with better reward structures, older and less rewarding cards lose their appeal. Naturally, in this case, most would prefer to shift focus to their newer cards. However, as the older cards are used less and less, or perhaps forgotten altogether, these cards may face account inactivity. If the period of inactivity extends long enough, then the financial institution may close the account.

I had first conceived of a tracking solution employing Excel to help prevent account closures. However, the initial solution was written using Visual Basic for Applications (VBA) which introduced difficulty when I aspired to make improvements. Furthermore, while Excel can be extremely intuitive due to its ubiquity, the application is quite inefficient and slow compared to a specialized solution.

Design Goals

- Remove the dependence on Excel and VBA by porting the initial solution to Python
- Retain and adapt useful features of Excel, namely its grid of cells
- Maximize the longevity of the solution by minimizing the number of Python dependencies
- Improve the solution's speed and footprint

Benefits

- Provides a lightweight application for tracking credit card usage
- Integrates with my personal YNAB account, allowing for an effortless sync with the financial service
- Ensures a long-term solution by minimizing Python dependencies, with the most likely point of failure being the `ynab-client` module
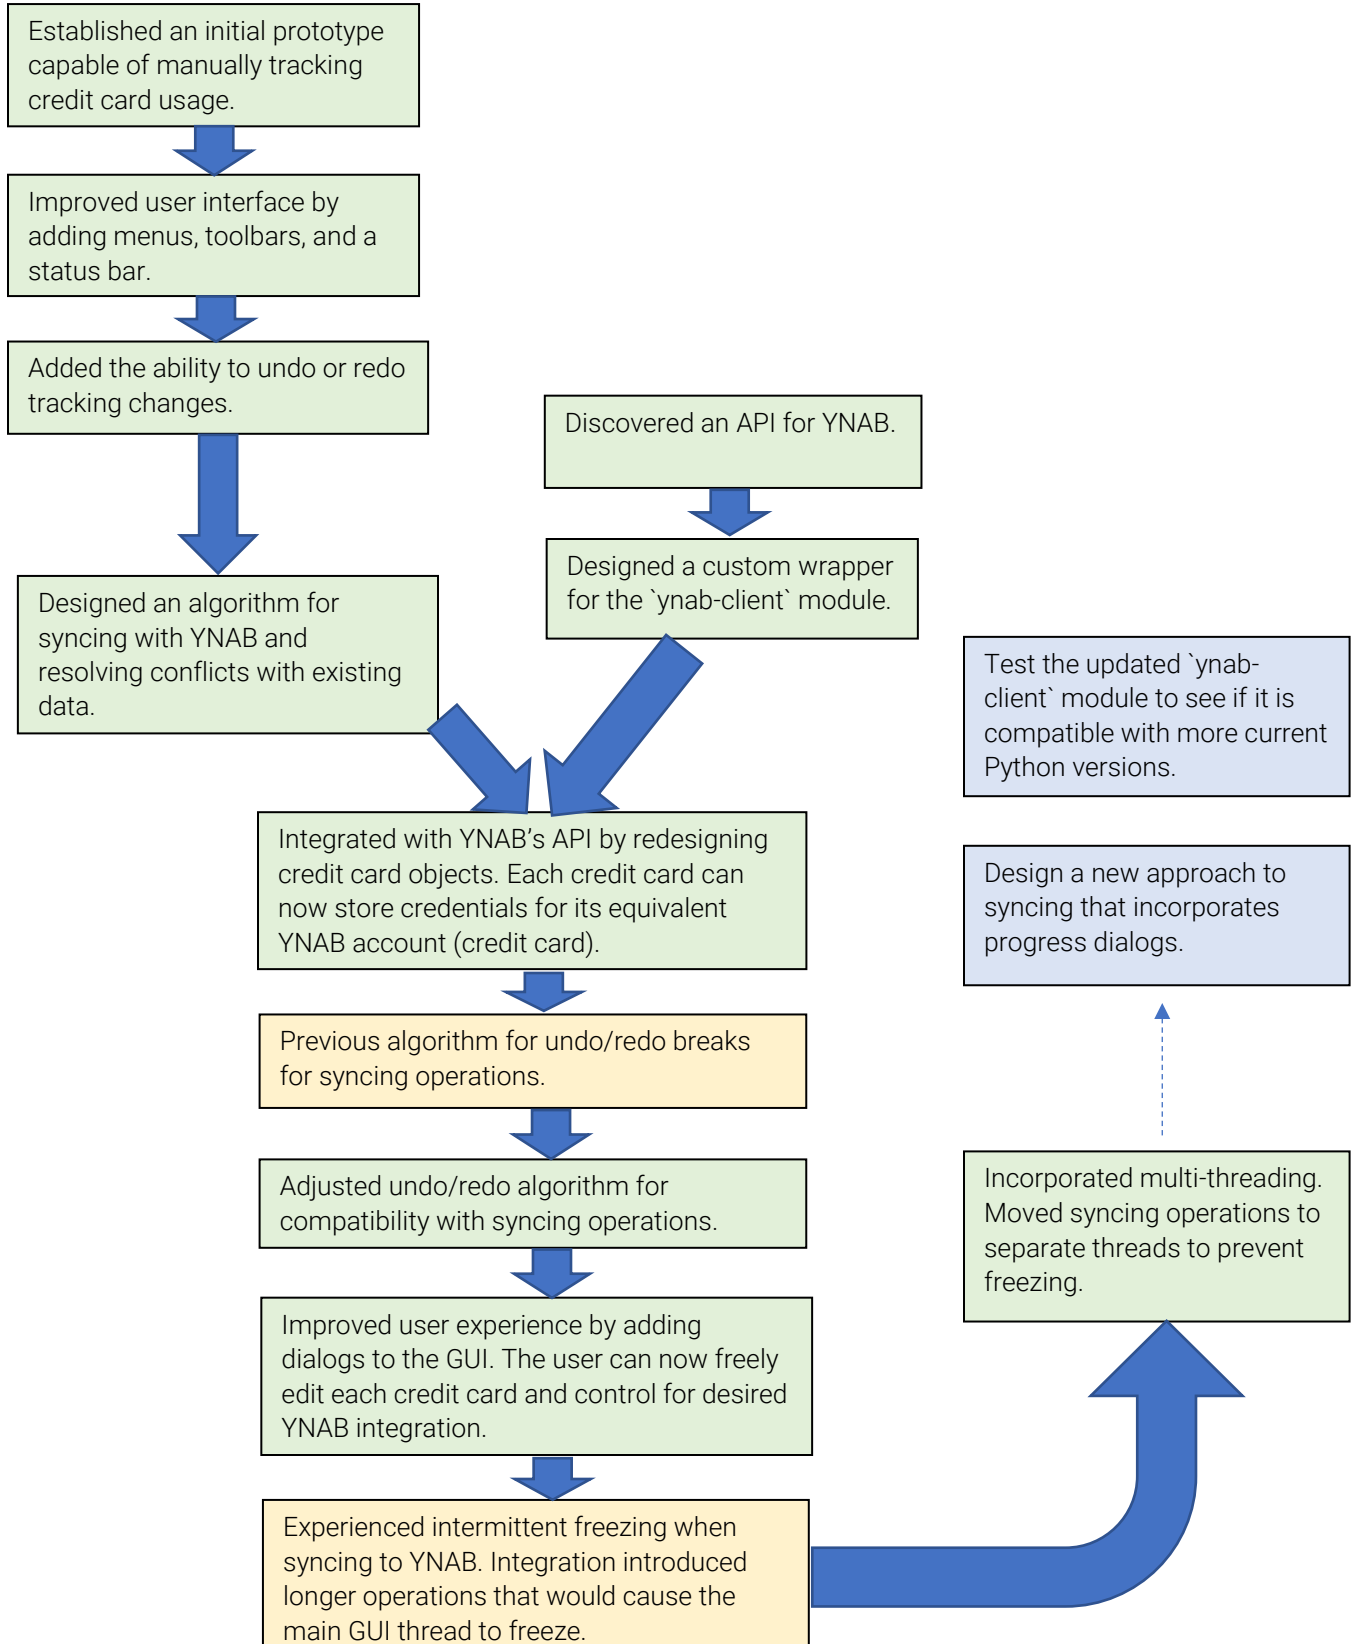

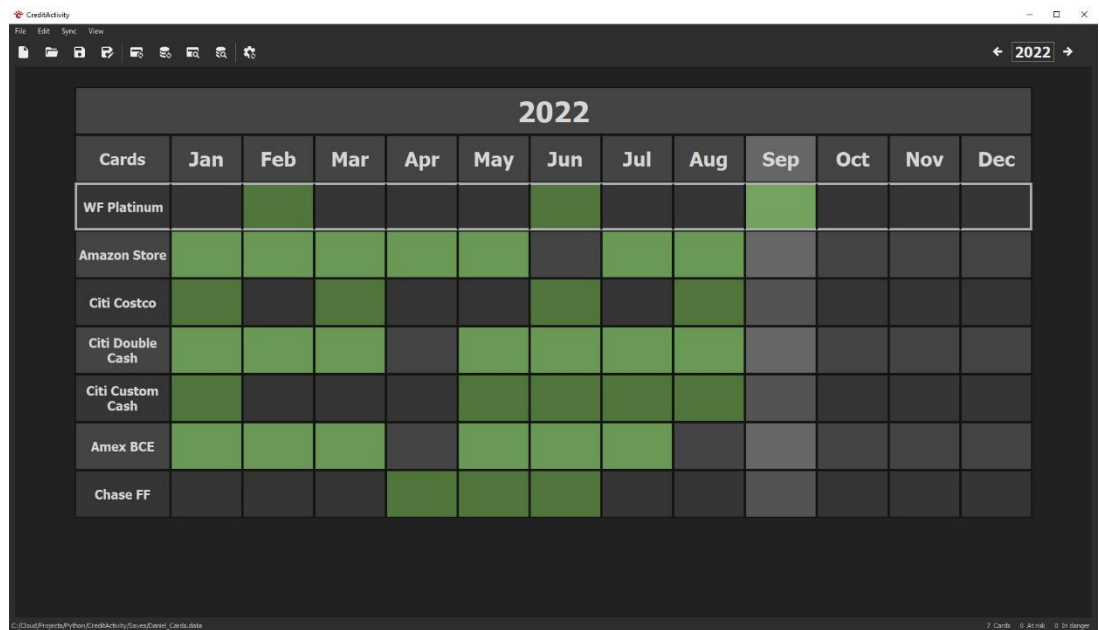

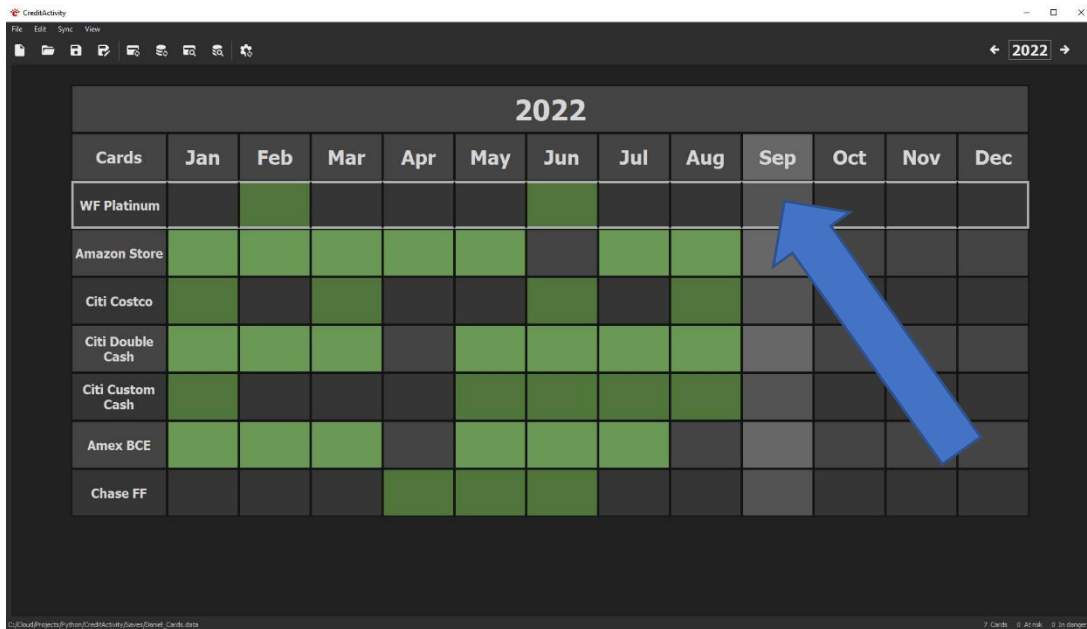

Languages

1. Python 3.6

Python Dependencies

1. pyqt5
2. ynab-client

Established an initial prototype capable of manually tracking credit card usage.

Improved user interface by adding menus, toolbars, and a status bar.

Added the ability to undo or redo tracking changes.

Discovered an API for YNAB.

Designed an algorithm for syncing with YNAB and resolving conflicts with existing data.

Designed a custom wrapper for the `ynab-client` module.

Test the updated `ynab-client` module to see if it is compatible with more current Python versions.

Integrated with YNAB's API by redesigning credit card objects. Each credit card can now store credentials for its equivalent YNAB account (credit card).

Design a new approach to syncing that incorporates progress dialogs.

Previous algorithm for undo/redo breaks for syncing operations.

Adjusted undo/redo algorithm for compatibility with syncing operations.

Incorporated multi-threading. Moved syncing operations to separate threads to prevent freezing.

Improved user experience by adding dialogs to the GUI. The user can now freely edit each credit card and control for desired YNAB integration.

Experienced intermittent freezing when syncing to YNAB. Integration introduced longer operations that would cause the main GUI thread to freeze.

21

1. Tracking Credit Card Activity

Clicking on a cell will activate it, indicating that the corresponding credit card was used that month.

2. Multi-Year Support
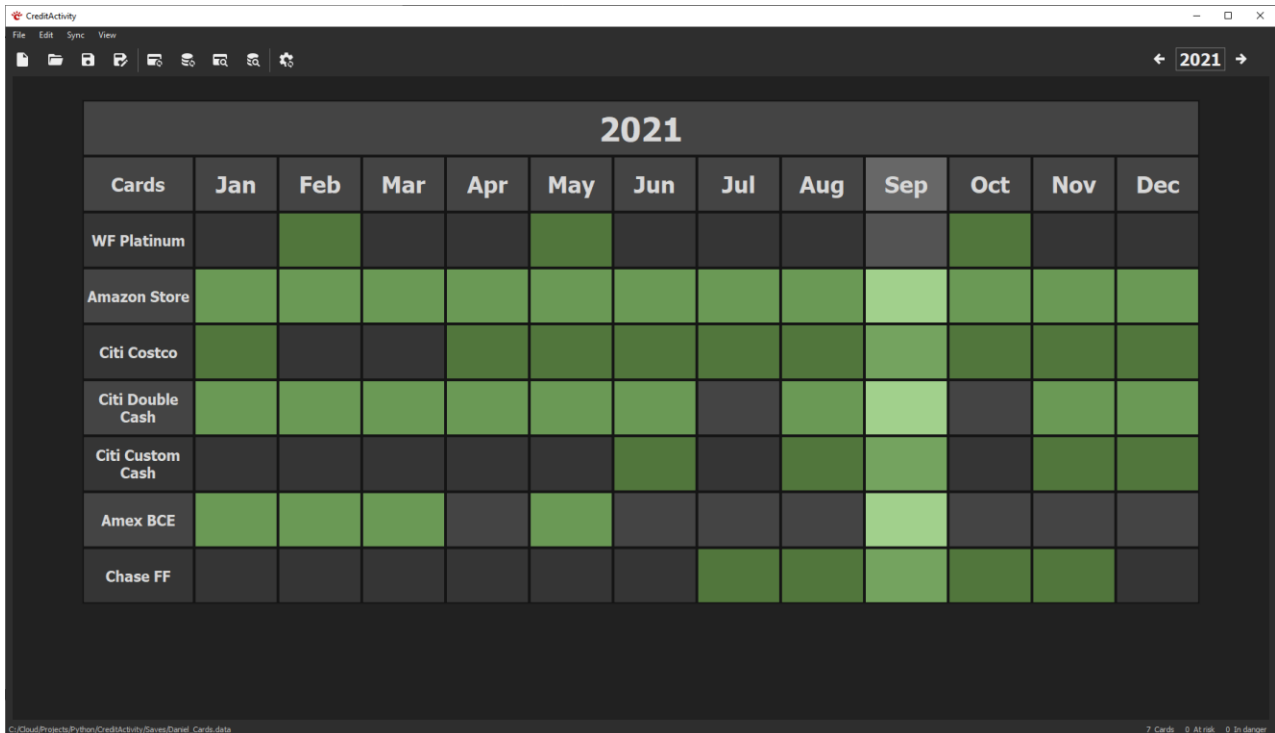

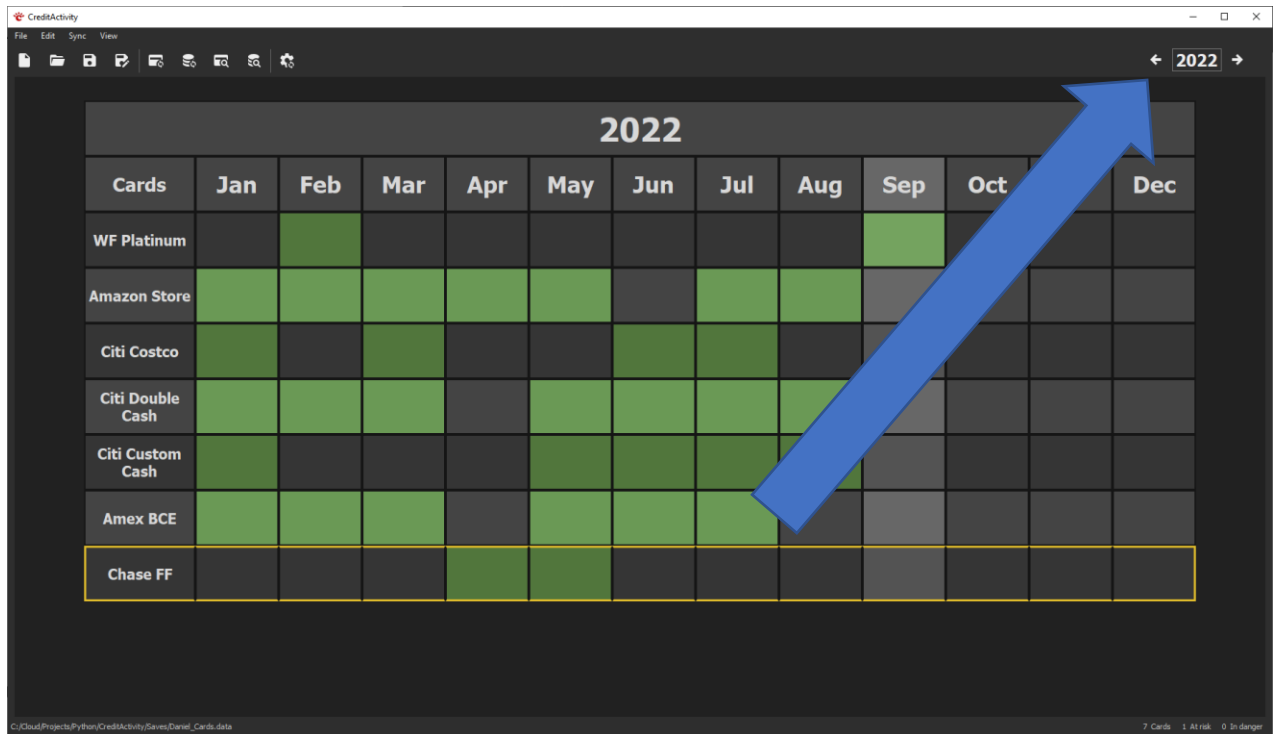

The current year for tracking credit card usage can be selected.

## 3. Creation of Credit Cards
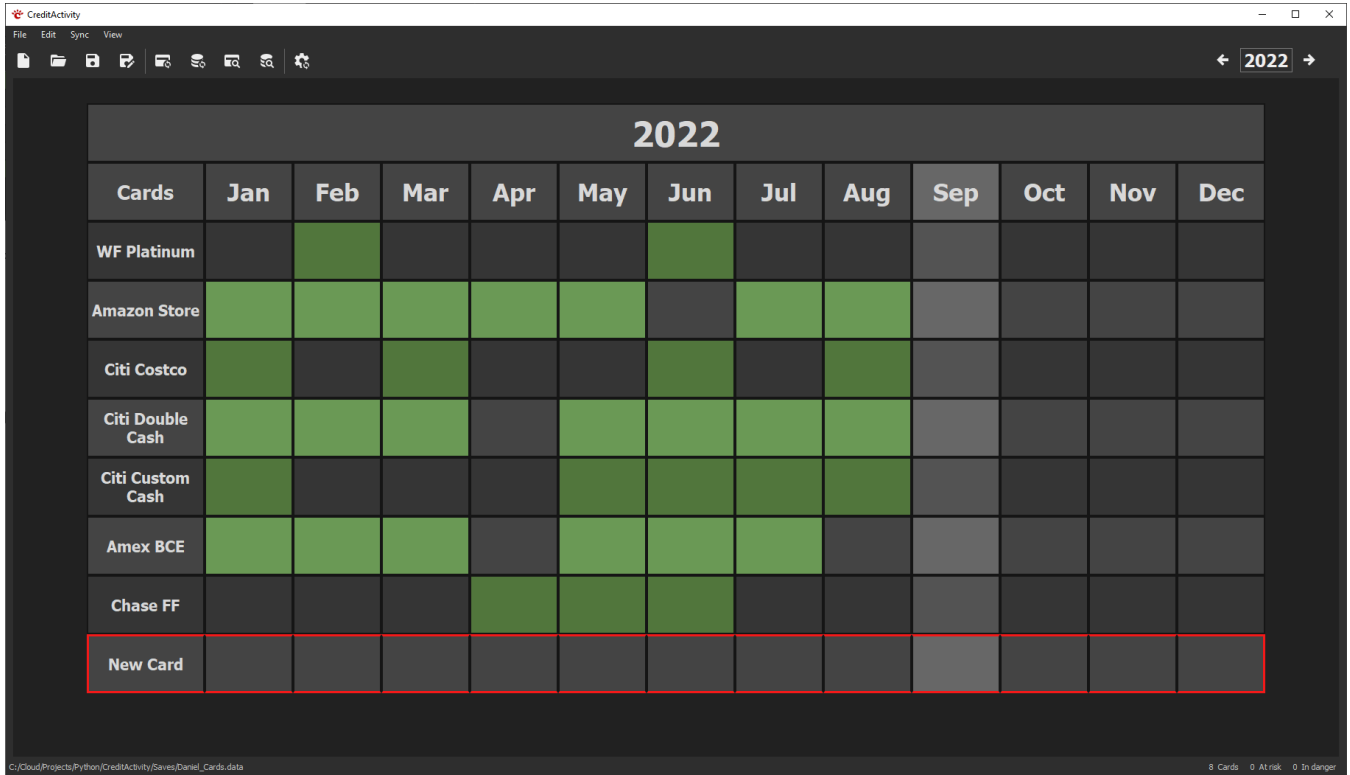

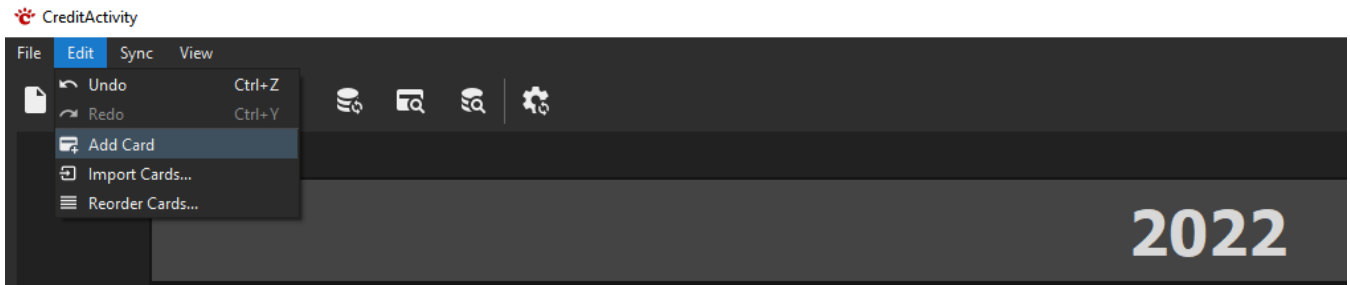

Cards can be created under the Edit menu.
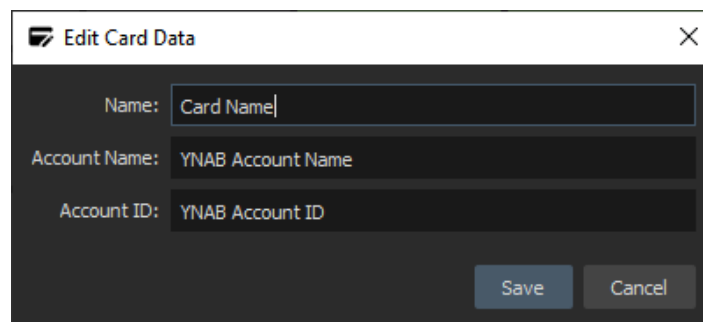

The card's name, YNAB account name, and YNAB account ID can be edited afterwards.
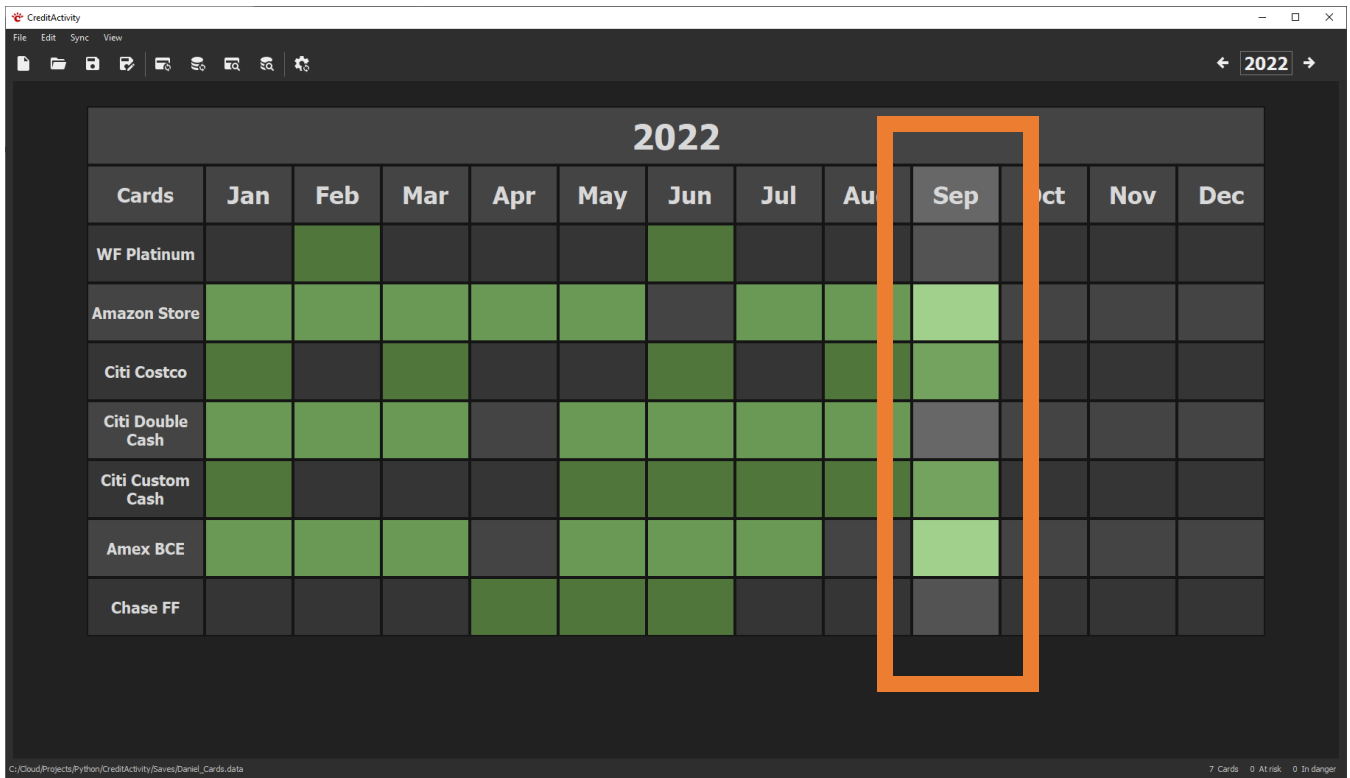

4. Credit Card Context Menu
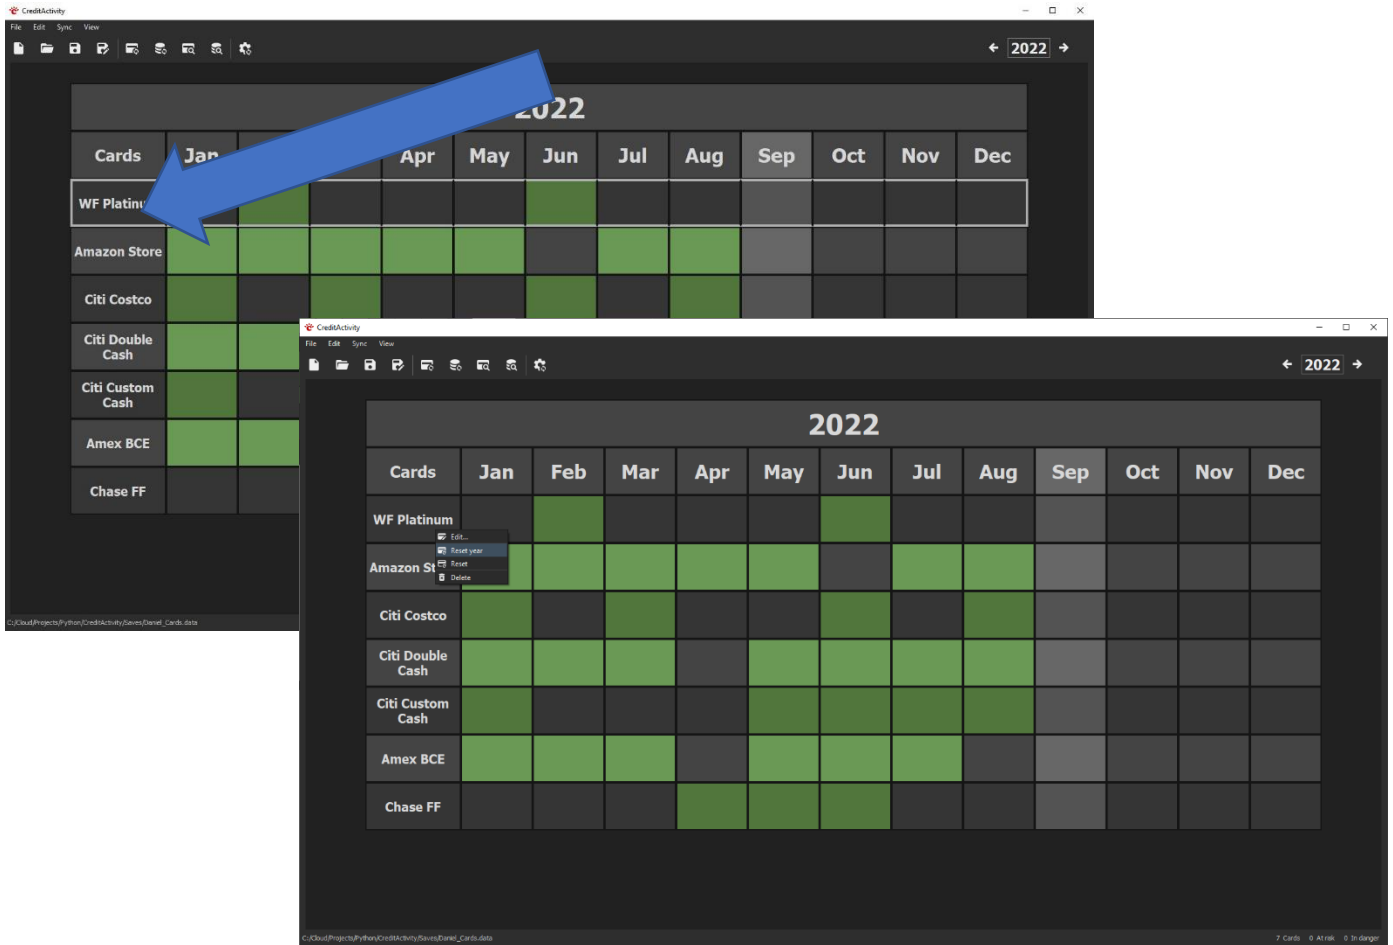

A context menu for credit cards can be accessed by right clicking on the name of a credit card. The context menu provides options for editing the name of the card, resetting its tracking history for the current year, clearing all tracking history, or deleting the card.

5. Reordering of Credit Cards
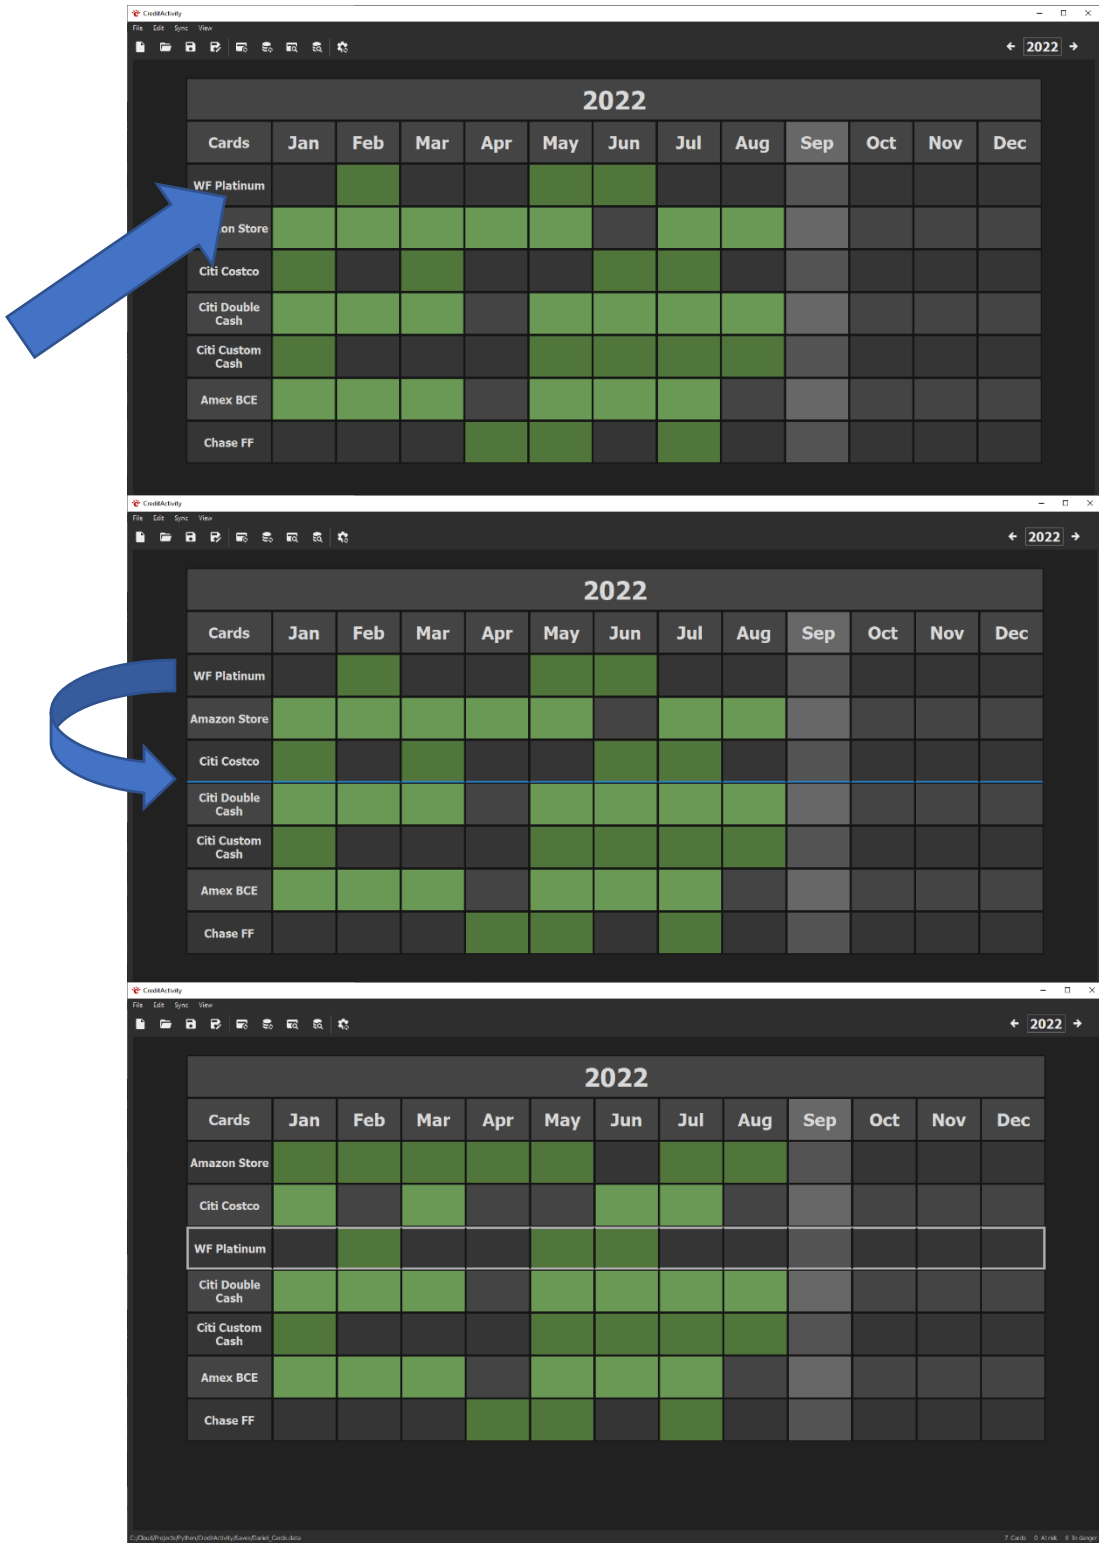

Credit cards can be reordered by clicking its name and then dragging it to the desired position.

6. Highlighting the Current Month

Cells under the current month are highlighted to contrast with other cells, thereby allowing the user to quickly discern the current month.

## 7. Highlighting of Inactive Credit Cards

Credit cards that have not been used within the last **4 months** are highlighted yellow to warn of inactivity.

Credit cards that have not been used within the last **7 months** are highlighted red to warn of **account closure**.

8. Integration with a YNAB Budget

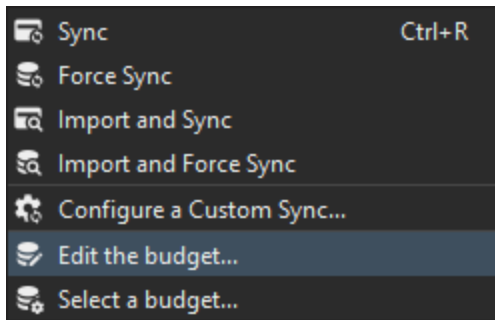

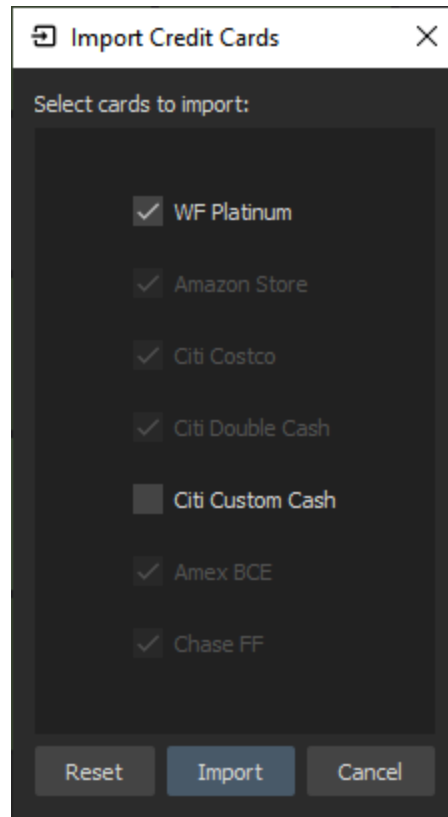

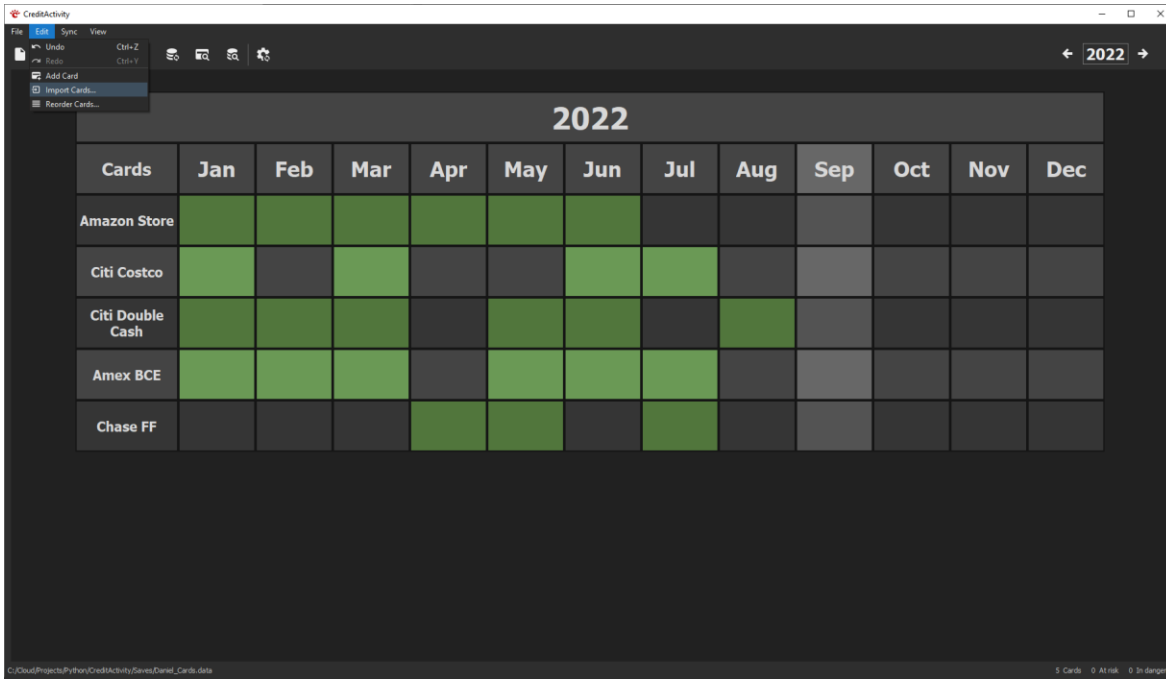

A desired YNAB budget can be selected under the Sync Menu, thereby providing integration with my personal YNAB account via the service's API.

9. Importing Cards from YNAB

After a valid YNAB budget has been selected, credit cards from YNAB can be imported into the application under the Edit Menu.

10. Syncing Tracking History with YNAB
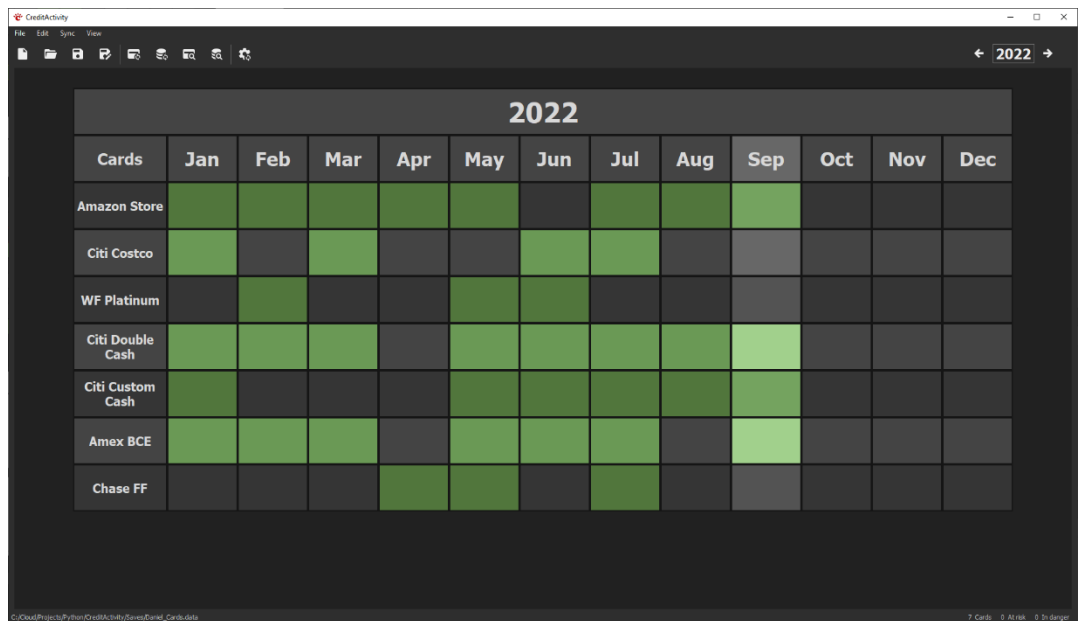

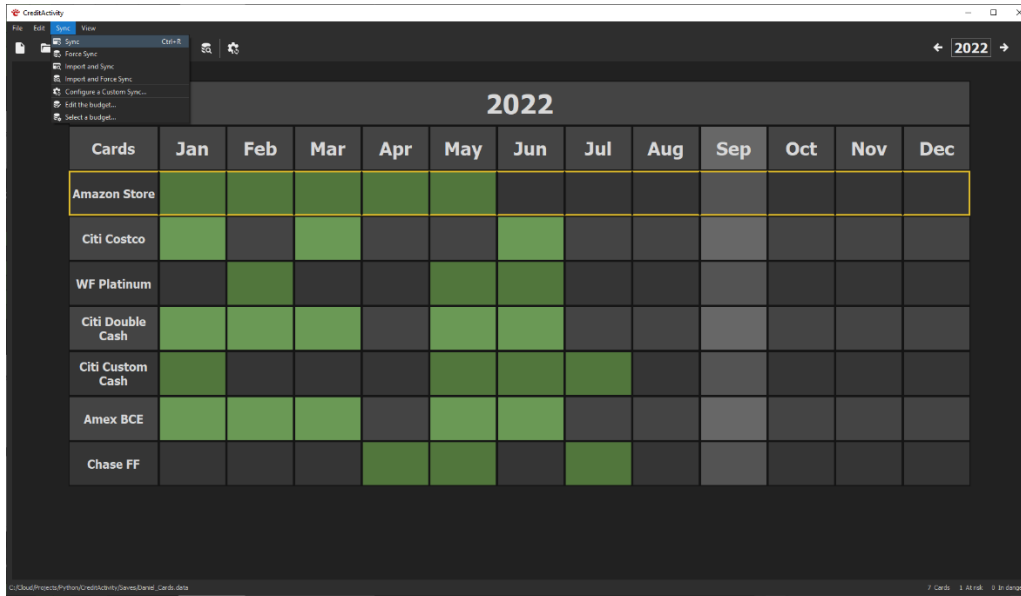

After a valid YNAB budget has been selected, tracking history can be synced with YNAB for quick and effortless tracking.
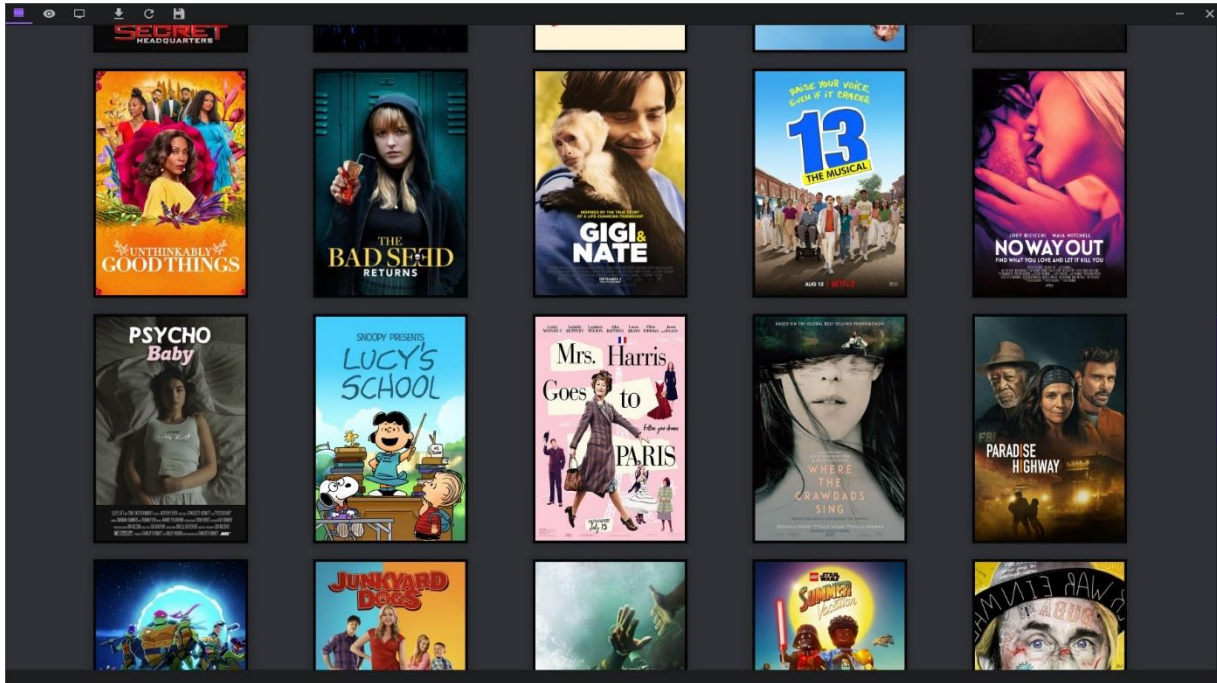

Eternals (2021)

PG-13 | 156 min | 05 Nov 2021

Action, Adventure, Fantasy

Following the events of Avengers: Endgame (2019), an unexpected tragedy forces the Eternals, ancient aliens who have been living on Earth in secret for thousands of years, out of the shadows to reunite against mankind's most ancient enemy, the Deviants.

1080P Pending

FRIENDS   ME   FOLLOWING

New Media Release
Eternals (2021)
4K

Project Description

Implements an application for tracking the Blu-ray releases of desired media.

The project consists of multiple components:

1. GUI Application
2. Raspberry Pi 3 / 4
3. Smartphone

The GUI application facilitates selecting desired media for tracking. Next, the Raspberry Pi is a low-power and low-cost solution for storing all data employed by the application within a database; moreover, the Raspberry Pi can perpetually check for Blu-ray releases at set intervals of time. Finally, once a release has been found, then the Raspberry Pi will send a push notification to my smartphone.

Motivation

I enjoy watching movies; however, not all movies deserve the same level of interest: for some movies, I would prefer watching at home rather than in the cinema. Ironically, I find difficulty in staying informed of the Blu-ray release of these movies.

In a similar manner, for TV shows, often I would prefer the greater bandwidth (quality) offered via Blu-ray as compared to streaming services.

Therefore, I aspired to design a solution to inform me of upcoming media and minimize as much effort required from me to track their Blu-ray releases.

Design Goals

- Provide a continually updating catalog of upcoming movies, reducing the need for me to stay updated with current releases

- Streamline the user experience by reducing or hiding loading times as much as possible

- Utilize the Raspberry Pi as a server for storing media data and tracking releases 24/7

Benefits

- Eliminates the need to manually check for Blu-ray releases

- Automatically notifies me of desired releases

## Languages

1. Python 3.8

Python Dependencies

1. requests
2. bs4
3. pyqt5
4. omdb
5. cinemagoer
6. python-dateutil
7. pushbullet.py
8. mysql-connector-python
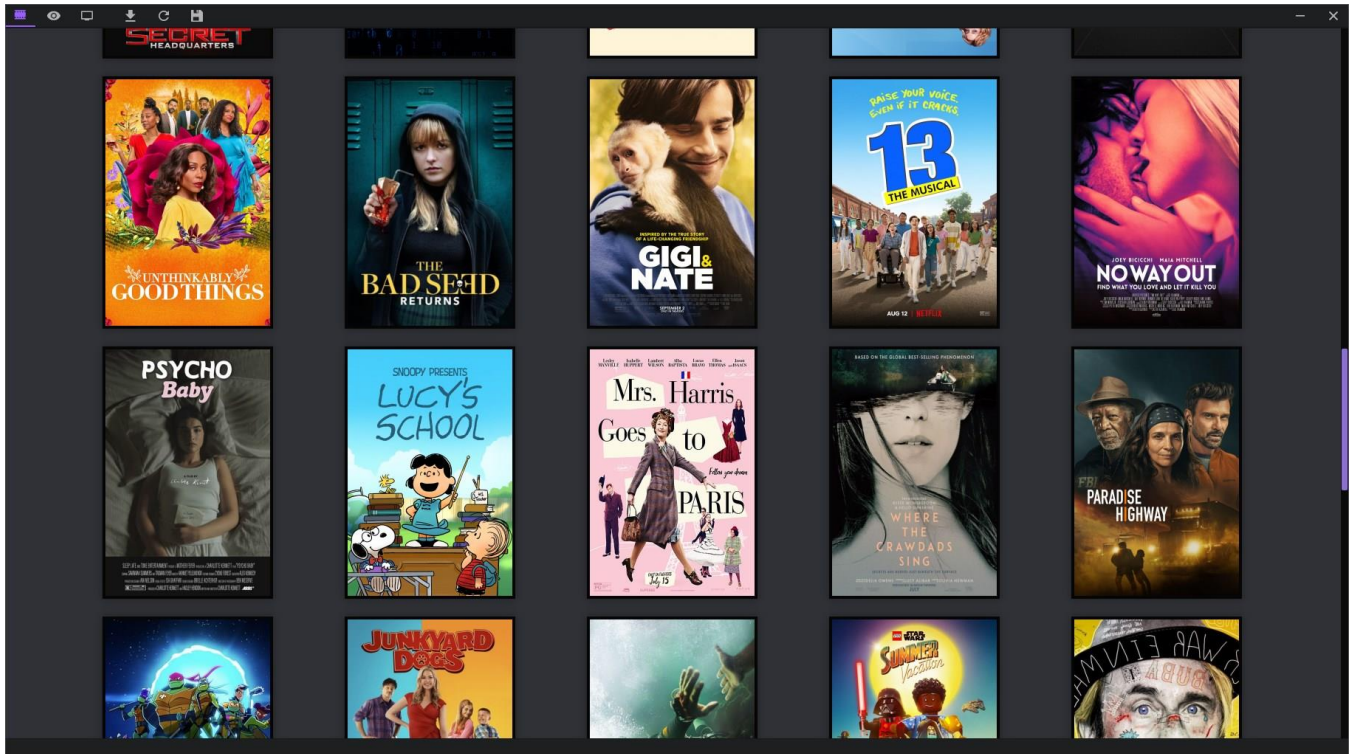

External Dependencies

1. Smartphone
2. Raspberry Pi 3 or 4
3. MariaDB
4. HeidiSQL

Established initial prototype for tracking Blu-ray releases. Media data is stored within a local database; tracking data is stored by the Raspberry Pi (RPi).

Experienced significant slowdown while starting the application: the local machine must search and process new media upon startup.

Added multi-threading to the search algorithm to speed up startup time.

Startup time speeds up but remains noticeably slow.

Redesigned the database and search approach. The RPi now stores the database, which includes all media and tracking data, and searches for new media.

Process for searching new media significantly slows due to the lower processing power of the RPi.

Leveraged the RPi's 24/7 operation by moving search operations to midnight. Long search times are hidden from the user.

Internet Movie Database (IMDb) changes its webpage. Searching functionality breaks.

Redesign the GUI as a more typical Qt application with standard menus, toolbars, and dialogs.

Abandon current GUI implementation with its custom appearance, which adds complexity and deters improvements.

Replaced IMDb with TMDb for media searches.

Designed an algorithm for searching new media from TMDb; ensured that found data is formatted like IMDb to reduce chances of unforeseen errors.

Created a wrapper for TMDb's API.

Discovered an API for The Movie Database (TMDb) for discovering new media.

1. Revolving Catalog of Newly Released Movies

The Raspberry Pi performs weekly checks for newly released or upcoming media and imports the data into its database. A revolving catalog is maintained by expunging undesired media outside of a three-month window from the current date.

The GUI application (pictured above) displays the revolving catalog to the user on a desktop PC.

2. Inspecting Media
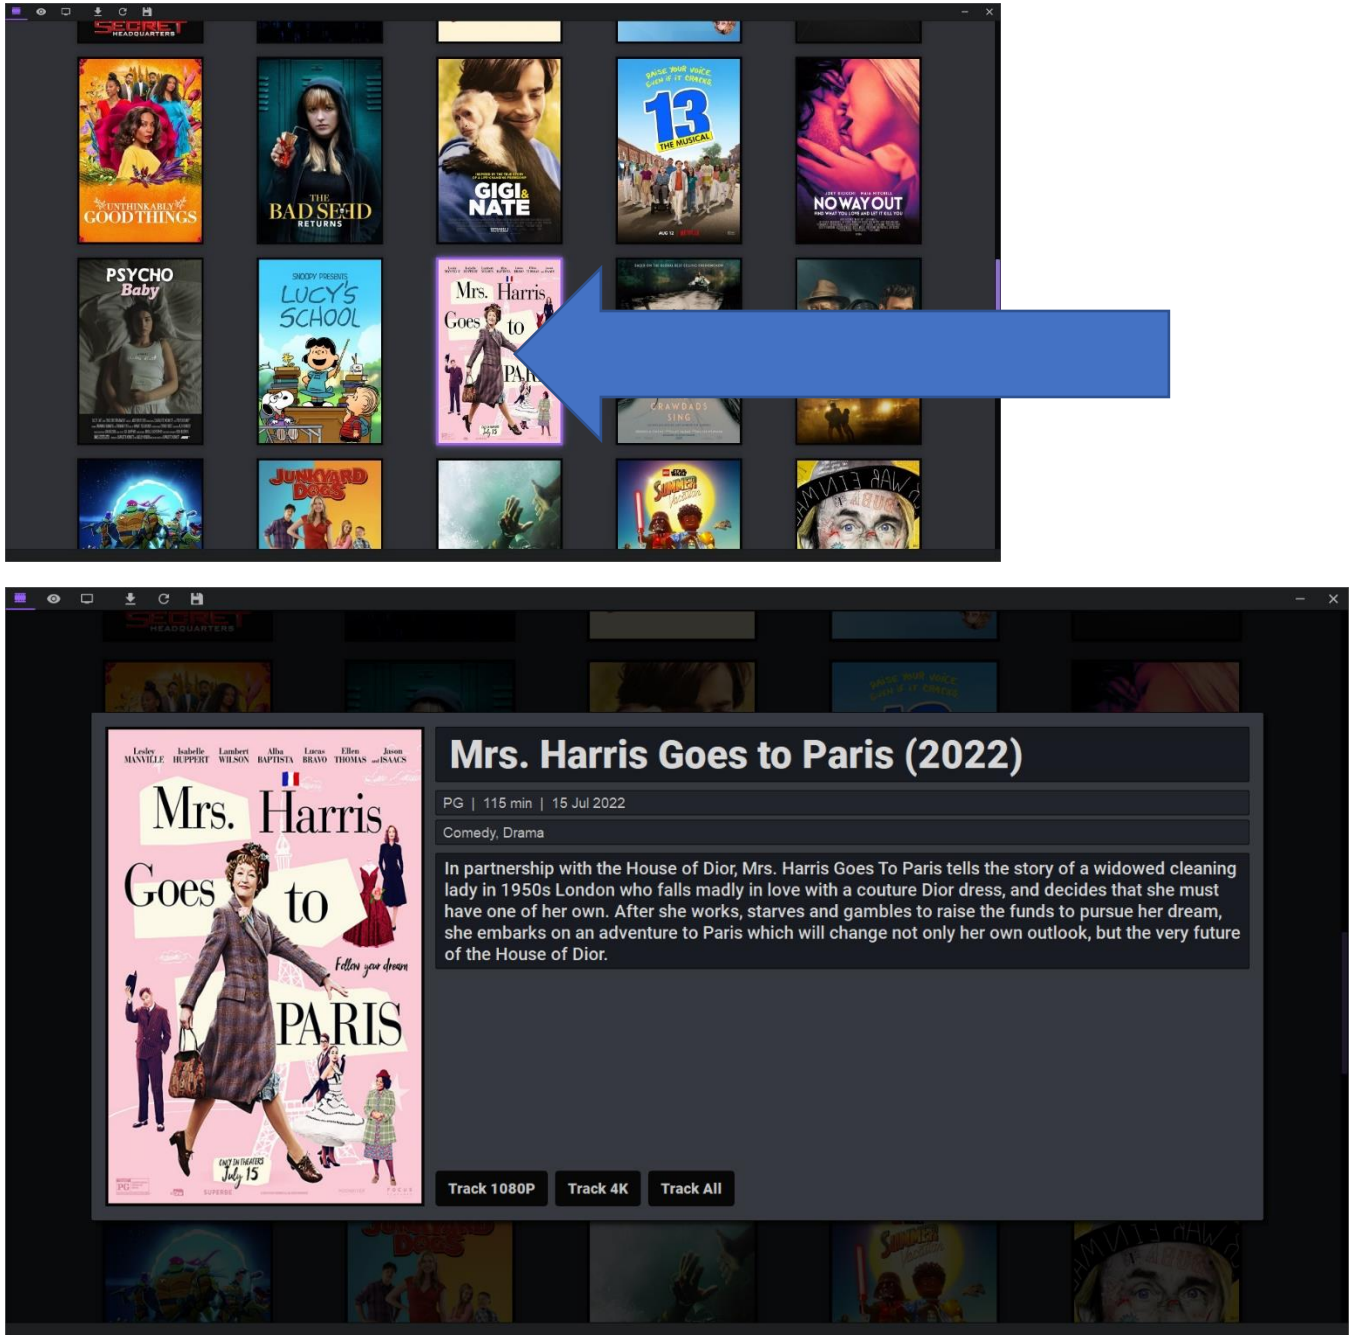

Left clicking a media will expose an inspection menu, providing options for tracking or untracking (if eligible) the media's Blu-ray release(s).

3. Checking the Blu-ray Release Status of Currently Tracked Media

Tracking the Blu-ray release of a media will transfer the media into a separate catalog of either desired movies or television shows.
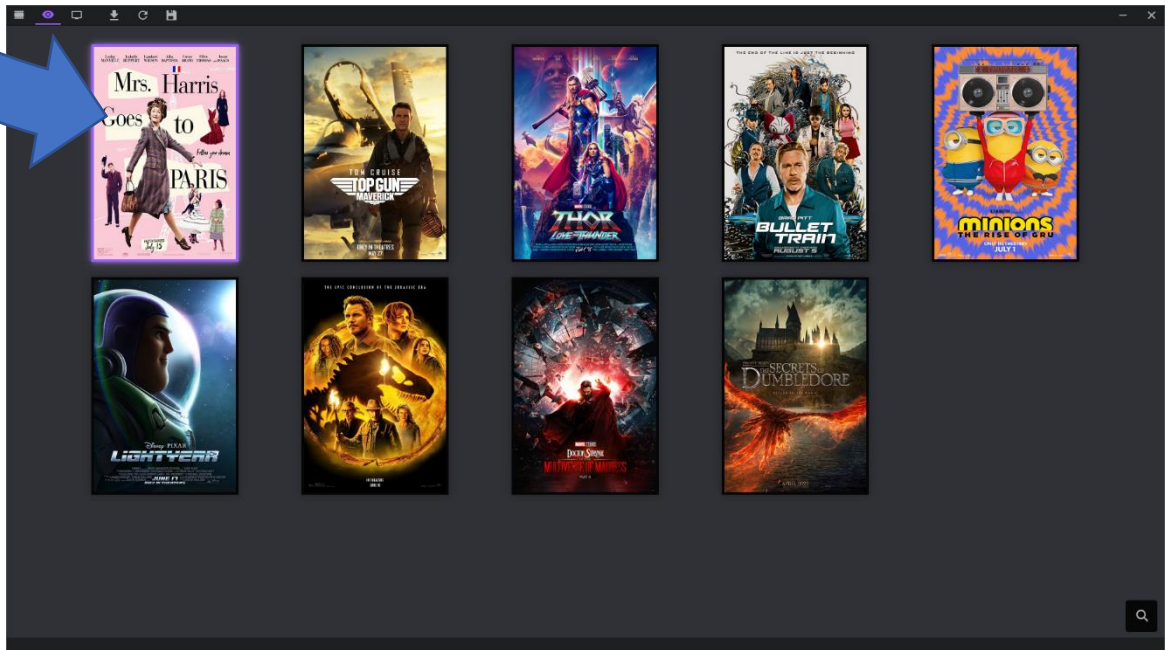

Mrs. Harris Goes to Paris (2022)

PG | 115 min | 15 Jul 2022

Comedy, Drama

In partnership with the House of Dior, Mrs. Harris Goes To Paris tells the story of a widowed cleaning lady in 1950s London who falls madly in love with a couture Dior dress, and decides that she must have one of her own. After she works, starves and gambles to raise the funds to pursue her dream, she embarks on an adventure to Paris which will change not only her own outlook, but the very future of the House of Dior.

1080P Pending   Track 4K   Untrack

The Blu-ray release status of a media can be checked by inspecting a desired (currently tracked) media.
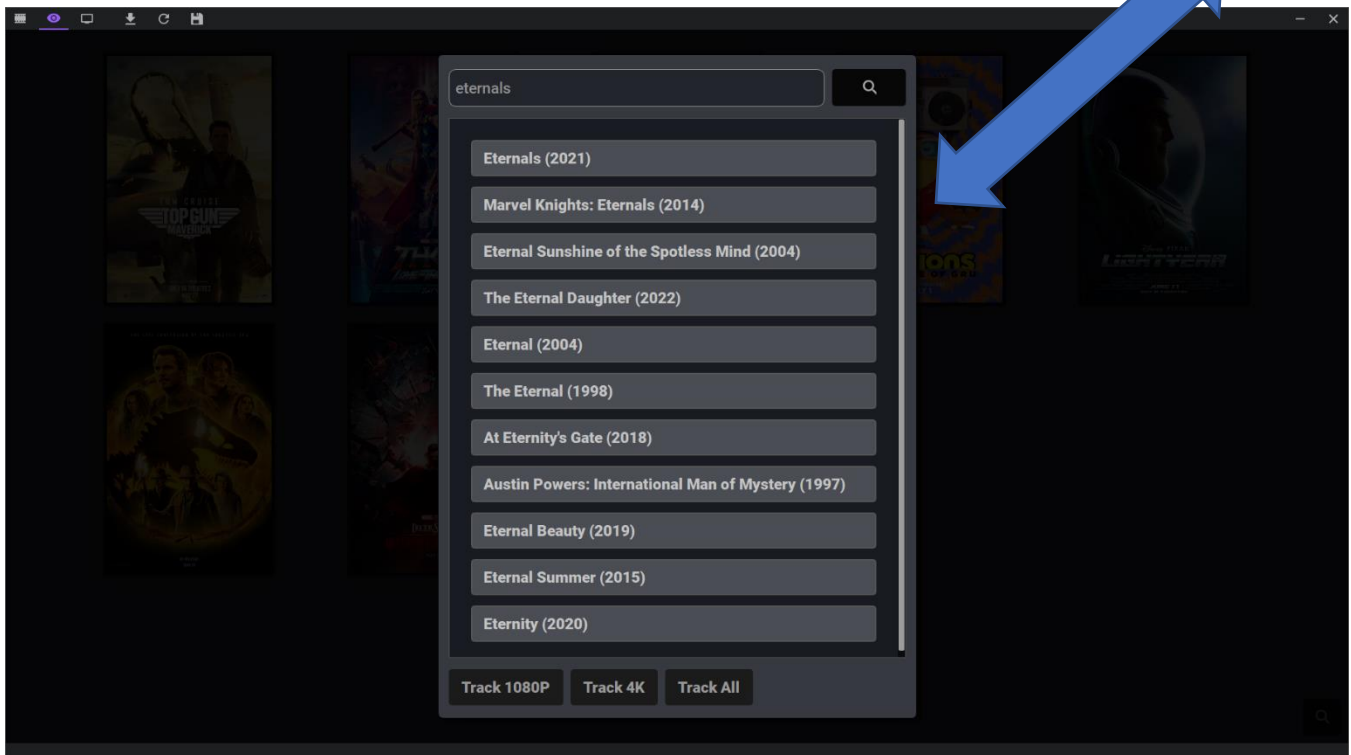

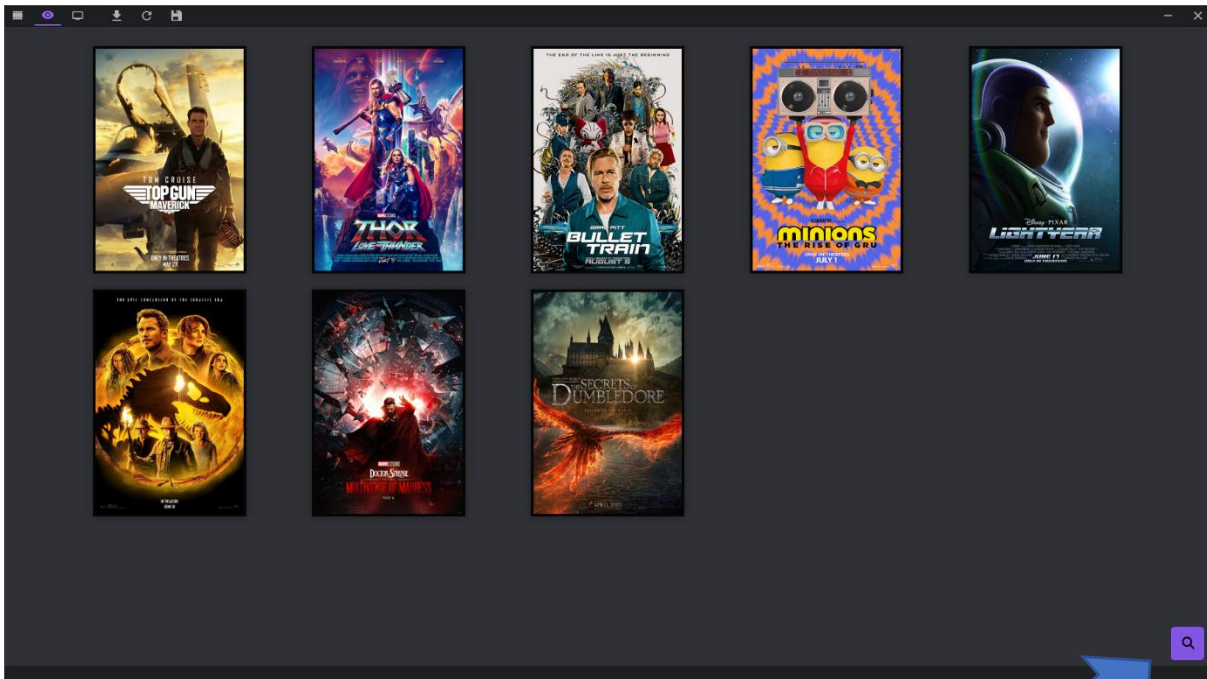

4. Media Context Menu
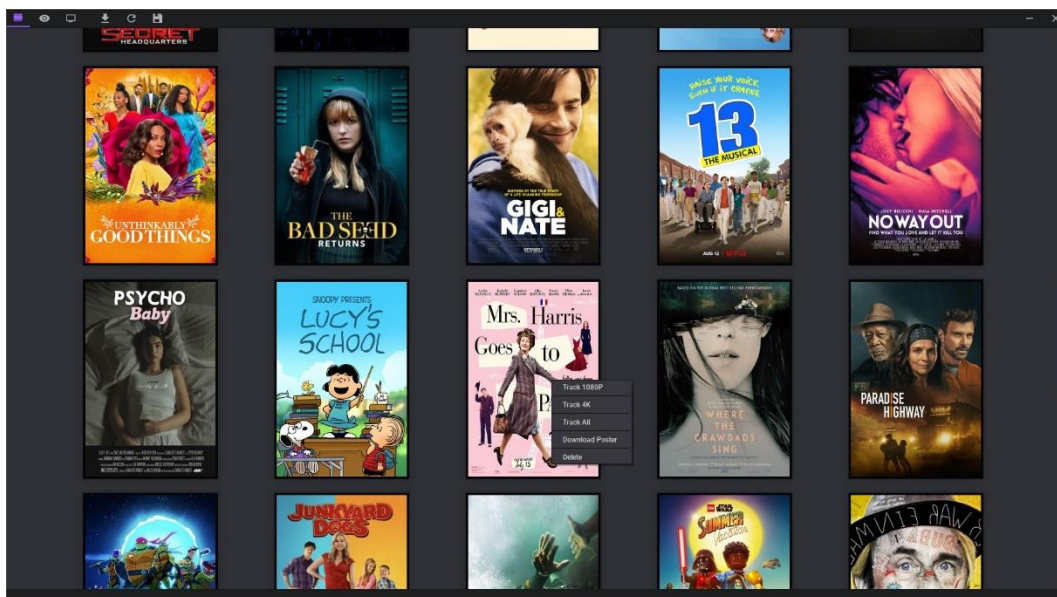

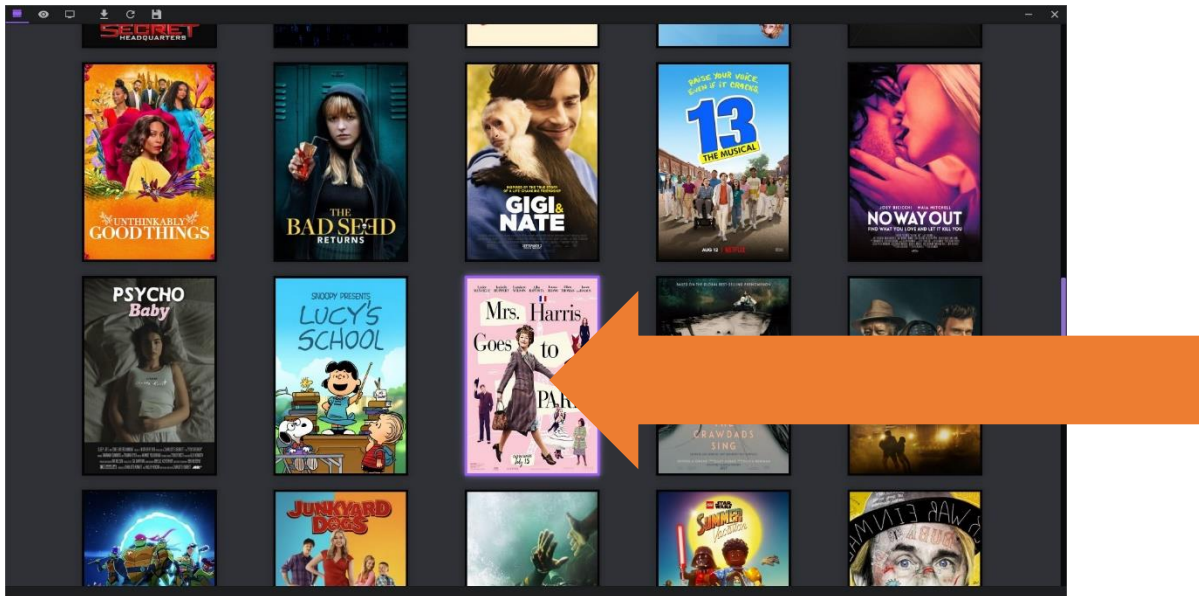

A context menu for media can be accessed by right clicking a media. The menu provides options for tracking or untracking a Blu-ray release, re-downloading (refreshing) the media's poster, or deleting the media from the database.
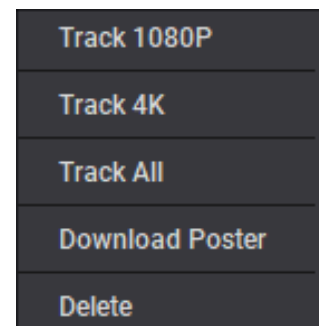

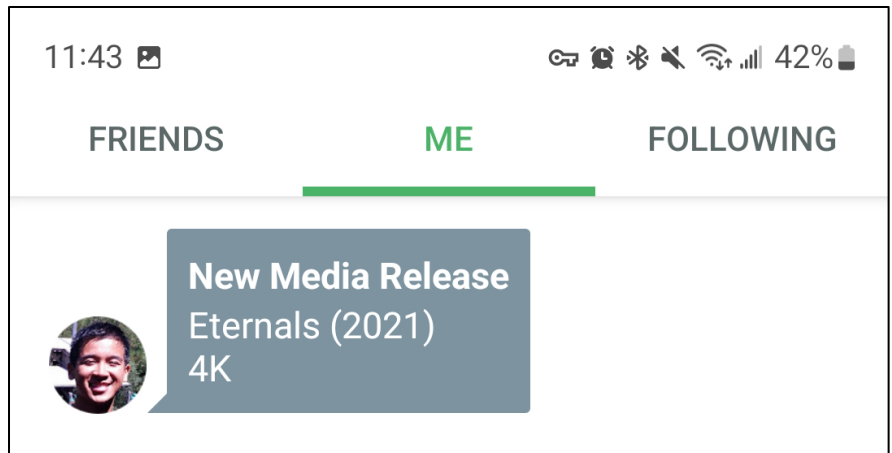

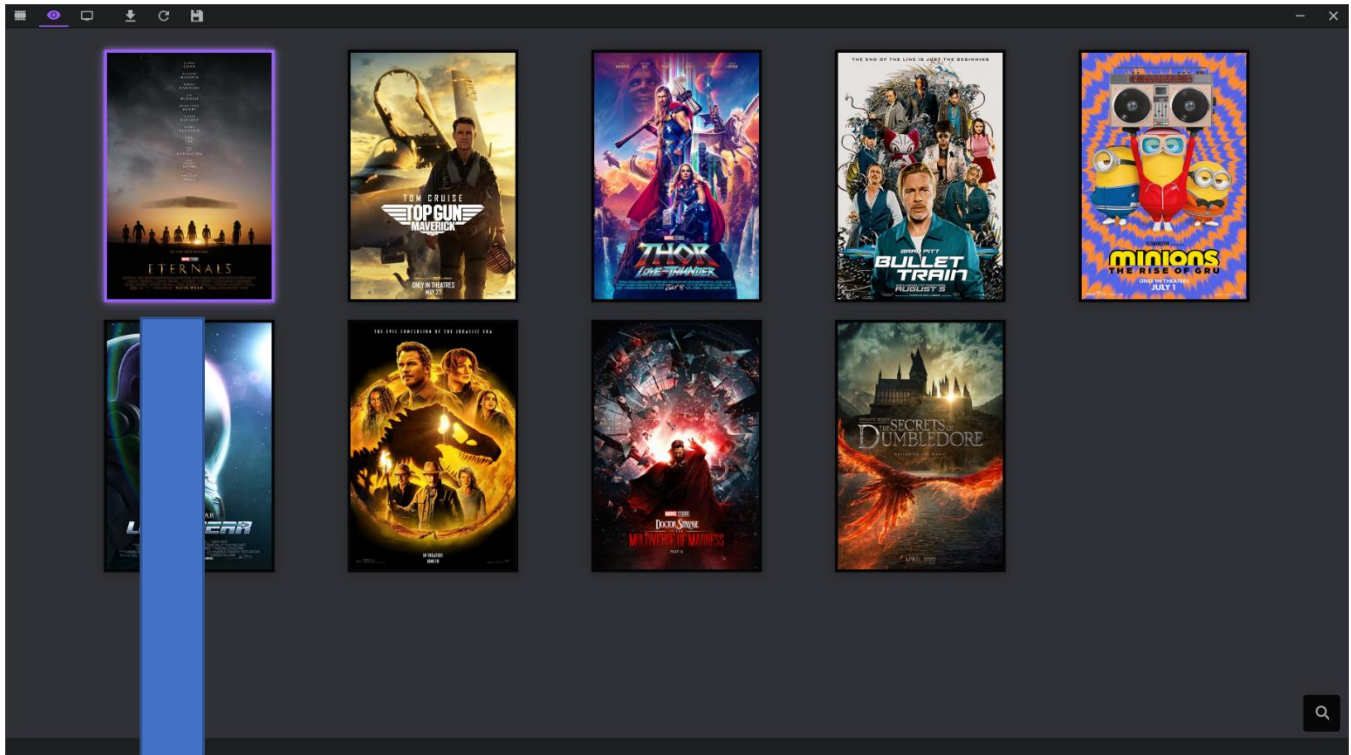

5. Manual Search for a Desired Movie or Television Show

Clicking the search button within the catalog for desired movies or television shows will expose a dialog for custom searches. For example, searching for Eternals will yield the results shown above.

6. Notification of a Blu-ray Release

The Raspberry Pi checks for desired Blu-ray releases at set intervals. Once a Blu-ray has been found, then the Raspberry Pi will send a push notification to my smartphone.
